A Study of Academic Anxiety in Relation to Mental Health in Adolescents

Munni Kumari

Assistant Professor, Shiv College of Education, Faridabad, Haryana, India, Affiliated to CRSU Jind

ABSTRACT

The present study was a preliminary attempt towards the study of Academic Anxiety in relation to Mental Health of Adolescent students of District Faridabad. For the present venture, Descriptive Survey was conducted on a sample of 100 Senior Secondary school students. The value of the sample was assessed using standardized tests namely Educational Anxiety Inventory by Dr. Vishal Sood & Dr. Arti Anand and Mental Health Battery by Arun Kumar Singh & Alpana Sen Gupta. The objective of the study was to find out the relationship between Academic Anxiety and Mental Health of Adolescents students. The obtained data were quantitatively analyzed by using descriptive and inferential statistics. The findings revealed that there is significant relationship between Academic Anxiety and Mental Health of Adolescent Boys and Girls of secondary schools at 0.01 and 0.05 levels of significance and they are negatively correlated.

Key Words: Academic Achievement, Mental Health and Adolescents

INTRODUCTION

Present age is the age of competition. Scientific and technological advancement all over the globe has been made man very conscious and sensitive about his studies, vocation, life style, relations etc. This immense progress has given rise to certain problems. One of the major problems of today’s world is “Anxiety”. Every person has a unique nature as regard to capabilities, attitude, personality characteristics and interests. The adolescents have a major impact of anxiety due to bloodshed competition in every field. The parents and teachers are eager to know the various factors, which enhance the anxiety among the students. Academic achievement expectations have created so much fear among the students that they are not able to utilize their basic potential. They are to only concentrate on their academic performance. Every child is not able to get first division as the level of mental health is not same in every child. Academic anxiety is a common issue that students cannot ignore if they want to succeed in school.

Academic anxiety is a kind of anxiety which relates to the imminent danger from the environment of the educational institutions together with teacher and certain subjects like Chemistry, Physics for numerical, Mathematics, and English to some extent for some north Indian states. It is a mental sensitivity of uneasiness or distress in response to school or college circumstances that is perceived negatively. Academic anxiety is totally not a bad thing. However it is true that a high level of anxiety interferes with concentration and memory which are critical for day to day academic performance and success, however it is also true without any anxiety, majority of us would lack the enthusiasm and motivation to study for exams, do everyday homework or write any research papers.

Mental Health means health of mind. It means harmonious functioning of the whole personality and measure of a person’s ability to shape his environment and to adjust to life with a reasonable amount of success efficiency and happiness. Mentally healthy persons are generally good workers, good friends & good citizens. A healthy mind maintains an even temper, an alert intelligence, socially considerable behavior & a happy disposition. The word MENTAL usually implies something more than pure cerebral functioning of a person. It also stands of his emotional effective starts, the relationship he establishes in his socio-cultural context. Similarly, HEALTH refers to more than physical health. Many people, when they hear of the term mental health think of absence of mental illness. When we speak of happiness, peace
of mind and enjoyment of satisfaction, we are usually talking about mental health. It has to do with everybody’s everyday life. It means overall ways in which people get along with their peers in their community.

**SIGNIFICANCE OF THE STUDY**

21ST century can be indicated as the century of competition. Everywhere there is a race, a competition. With the huge development in science and technology, all part of the world is connected with this competition. Especially in the field of education, this competition rapidly increased among the students. Curriculum and co-curricular offerings have tremendously expanded, gripping the students in the adjustment problems. Feeling the insecurity, conflicts within themselves, bad company and low achievement creates emotional tensions and anxiety among the students. They are unable to face the changing trends in the society, the students are taking to drug addiction and even the suicidal note is increasing. To survive in this competitive and complicated world, Good Mental Health is required to all to cope up with all such adjustment problems and anxious atmosphere but school students have been found to have high prevalence of mental health problems.

In recent years, issues related to mental health are often propaganda in mass media not only in a country and even around the world. Mental health is a way of thinking, feeling and behaviour in a person’s daily lives. A Person with a healthy mental health can recognize himself on the ability, willing to accept failure, able to control his/her emotions and appreciate him/her. Mental health may deteriorate and its negative effects will affect the daily lives without treatment. Poor mental health leads to stress, anxiety and poor performance in the scholastic skills.

Different studies of Academic Anxiety and Mental Stress have been conducted like Agashe (1991) [2], Mohanty (1992) [9], Ojha and Rani, (2004) [10], Dholakiya and Jansari (2005) [5], Sanwal, Dube, and Bhatnagar (2006) [6], Agarwal and Sarna, (2009) [1], Gupta and Kumar, (2010) [7], Kumari, N. (2013) [8], Das, Halder and Mishra (2014) [4], Bartwal, R.S. (2014) [3], Deb, Strodl and Sun (2015) [13], Sharma and Sarin (2016) [12] and Sharma and Pandey (2017) [11] with different variables like Academic Achievement, Academic Stress, Spiritual Intelligence, Emotional Intelligence, Parental Rearing Styles, Parental Support, Self Esteem and Self Confidence etc. showing different results. But there is a dearth need of a study which sees the effect of Academic Anxiety and Mental Health together. Moreover, there are a few number studies have been conducted in the field of Mental Health. Mental Health is a deliberating factor which impact on students’ Academic Anxiety. These factors necessitate a moral formal, systematic and intensive process of carrying on the methods of analysis. A systematic structure of investigation must be involved to improve the performance of students in different shapes to introduce an atmosphere conductive to intellectuals and to minimize the anxiety of students because a manageable level of Academic Anxiety is actually a good thing. Moderate Academic Anxiety provides the motivation students require to exert effort completing assigned schoolwork and preparing to take examinations. Academic Anxiety only becomes a problem that needs a solution when the amount experienced grows so excessive that a student is no longer able to function. There was a need of empirical study in this field. It was in this context that present venture was planned and executed. Present study is a humble effort to answer the query i.e. why students feel anxiety and is this academic anxiety is related to their mental health?

**OBJECTIVES OF THE STUDY**

The Present research was conducted keeping in mind the following objectives:

- To study the difference between the mean scores of Academic Anxiety of Adolescent Boys and Girls.
- To study the difference between the mean scores of Mental Health of Adolescent Boys and Girls.
- To study the relationship between Academic Anxiety and Mental Health of adolescent.

**HYPOTHESES OF THE STUDY**

The researcher will be used Null Hypotheses to remain unbiased. The following Hypotheses will be framed for the present study:

**H1:** There will be no significant difference between the mean scores of Academic Anxiety of adolescent boys and girls.

**H2:** There will be no significant difference between the mean scores of Mental Health of adolescent boys and girls.

**H3:** There will be no significant relationship between Academic Anxiety and Mental Health of adolescents.

**SAMPLE**

The random sampling (students were chosen in such a way that each has an equal and independent chance of being selected) was used to carry out this research work. The figure that shows the distribution of sample has given below:
Kumari: A study of academic anxiety in relation to mental health in adolescents

The sample was taken from two Private Schools namely S. D. Public Sr. Sec. School and Anupam Public School affiliated to Board of School Education (BSEH), from city Faridabad (Haryana). A random selection of 100 adolescent students, 50 adolescents’ students from each school, of age group 13-16 years of Class IX were selected for the present study. From these 100 students, 50 students were Adolescent Boys and 50 students were Adolescents Girls.

**METHODOLOGY**

Keeping in mind the nature of the present research, the researcher has been used Descriptive Survey Method to conduct this study.

**TOOLS & TECHNIQUES**

Various devices are used for collecting new unknown data required for the study of any problem for each and every type of research. The following two tools will be used by investigator to conduct this study. They are:

- Educational Anxiety Inventory of Dr. Vishal Sood & Dr. Arti Anand.
- Mental Health Battery of Arun Kumar Singh & Alpana Sen Gupta.

**STATISTICS USED FOR THE PRESENT STUDY**

- For the present study Mean was calculated for average Academic Anxiety and Mental Health.
- Standard Deviation (S.D.) was calculated to find out variability of Academic Anxiety and Mental Health.
- t-value was calculated to study the comparison of Academic Anxiety on Adolescent Boys and Girls
- t-value was calculated to study the comparison of Mental Health on Adolescent Boys and Girls.
- Pearson’s Product Moment coefficient of correlation was calculated to estimate the relationship of Academic Anxiety and Mental Health.

**ANALYSIS AND INTERPRETATION**

In the present chapter analysis and interpretation has been presented in the following manner:

**Objective No 1:** To study the difference between the mean scores of Academic Anxiety of Adolescent Boys and Girls.

It can be observed from the table 1 that the mean score of Boys and Girls on Academic Anxiety are found to be 120.02 and 135.38 with Standard Deviation (S.D.) 12.48 and 10.64 respectively. The t-value between the two genders comes out to be 2.08 which is greater than tabled value. It indicates that Boys and Girls differ significantly at 0.05 level. Therefore null hypothesis “There will be no significant difference between the mean scores of Academic Anxiety of Adolescent Boys and Girls” is rejected.

Further the comparison of mean scores reveals that the mean score of Girls are higher than that of Boys scores. Hence, it means that the Adolescents Girls show greater Academic Anxiety than Adolescents Boys. The result is supported by Kumari, Neelam (2013) and Das, Halder and Mishra(2014) [8, 4].

In order to see the mean and standard deviation scores of Adolescent Boys and Girls and t-value at a glance these results have been given in figure :2.

**Table 1: Significance of Difference between the Mean Scores of Adolescent Boys and Girls on Academic Anxiety**

<table>
<thead>
<tr>
<th>Gender</th>
<th>N</th>
<th>Mean</th>
<th>Standard Deviation (S.D.)</th>
<th>t-value</th>
<th>Level of Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>50</td>
<td>120.02</td>
<td>12.48</td>
<td>2.08</td>
<td>Significant at 0.05</td>
</tr>
<tr>
<td>Girls</td>
<td>50</td>
<td>135.38</td>
<td>10.64</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Figure 2: Diagramatic Representation of the Significant Difference between the Mean Scores of Adolescent Boys and Girls on Academic Anxiety.

Figure 2 shows the mean scores of adolescent boys and girls on Academic Anxiety. And it can be interpreted that Girls have shown higher Academic Anxiety in comparison to Boys.

**Objective No 2:** To study the difference between the mean scores of Mental Health of Adolescent Boys and Girls.

Table 2: Significance of Difference between the Mean Scores of Adolescent Boys and Girls on Mental Health

<table>
<thead>
<tr>
<th>Gender</th>
<th>N</th>
<th>Mean</th>
<th>Standard Deviation (S.D)</th>
<th>t-value</th>
<th>Level of Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>50</td>
<td>105</td>
<td>9.71</td>
<td>2.13</td>
<td>Significant at 0.05</td>
</tr>
<tr>
<td>Girls</td>
<td>50</td>
<td>92.38</td>
<td>10.92</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

It can be observed from the table 2 that the mean score of Boys and Girls on Mental Health are found to be 105 and 92.38 with Standard Deviation (S.D.) 9.71 and 10.92 respectively. The t-value between the two genders comes out to be 2.13 which is greater than the tabled value. It indicates that Boys and Girls differ significantly at 0.05 level. Therefore null hypothesis “There will be no significant difference between the mean scores of Mental Health of Adolescent Boys and Girls” is rejected.

Further the comparison of mean scores reveals that the mean score of Boys are higher than that of Girls scores. Hence, it means that the Adolescents Girls show better Mental Health than Adolescents Boys. The result is also supported by Agarwal and Sarna (2009) and Gupta and Kumar (2010) [1, 7].

In order to see the mean and standard deviation scores of Adolescent Boys and Girls and t-value at a glance these results have been given in figure 3.

Figure 3 shows the mean scores of adolescent boys and girls on Mental Health. And it can be interpreted that Girls have shown better Mental Health in comparison to Boys.

**Objective No 3:** To study the relationship between Academic Anxiety and Mental Health of Adolescents Boys and Girls.

Table 3: Significance of Difference of Correlation between Academic Anxiety and Mental Health

<table>
<thead>
<tr>
<th>Variables</th>
<th>N</th>
<th>R</th>
<th>Level of Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Academic Anxiety</td>
<td>100</td>
<td>-0.19</td>
<td>Significant at 0.01 level</td>
</tr>
<tr>
<td>Mental Health</td>
<td>100</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

It could be observed from table 3 that obtained coefficient of Pearson’s Product Moment Correlation of Academic Anxiety and Mental Health of Adolescent Boys and Girls is -0.19 which is greater than the tabled value at 0.01 and 0.05. Therefore null hypothesis “There will be no significant relationship between Academic Anxiety and Mental Health of Adolescent Boys and Girls” is rejected. Thus it can be reframed as Academic Anxiety and Mental Health of Adolescent Boys and Girls related significantly. Thus it can be interpreted that Academic Anxiety and Mental Health are negatively correlated with each other.

In order to see the coefficient of Pearson’s Product Moment Correlation of Academic Anxiety and Mental Health of Adolescent Boys and Girls at a glance this result have been given in figure 4.

Figure 4 shows the scores of coefficient of Pearson’s Product Moment Correlation of Academic Anxiety and Mental Health of Adolescent Boys and Girls. And it can be interpreted that Academic Anxiety and Mental Health are negatively correlated.
It is concluded that academic anxiety affects the mental health of adolescents and if not taken care of properly, may result in disorder. So, teachers and parents should bestow the quality time to adolescents to gain a better mental health.
